Franceinfo imagines a hot summer on August 16, 2050

#ODD4 #France TV

With a summer of 2018 which was the second hottest in the history of France behind the 2003 heat wave, Franceinfo imagined what a hot weather day would look like in August 2050. According to the Jouzel report on the future climate in France, Average summer temperatures will increase from 0.6 to 1.3 ° C by 2050 with more frequent and longer heat waves.

In a speculative fiction based on the work of Météo France and the National Observatory of the effects of global warming, France Television imagine what will be the consequences of these episodes of heat wave and how we adapt to these sweltering summers.
